

Business analysis report

January 1–June 29, 2026 | 400 orders | Executive edition

Purpose

A data-grounded view of sales performance, customer-name segments, discount exposure, delivery duration and management priorities. Includes a refreshable interactive dashboard and auditable calculation workbook.

Executive scorecard

Net sales: 68,512,455.79 CU. Gross sales: 74,113,394.00 CU. Discounts: 5,600,938.21 CU. Units: 4,446. Average order value: 171,281.14 CU.

Primary finding

Electronics accounts for 86.2% of net sales. Monthly performance is therefore highly exposed to this category and its high-value orders.

Interpretation guardrails

No currency, cost, margin, target, customer IDs, order status, promised delivery dates or external market context is supplied. This report describes the supplied records; it does not assert business profitability or late delivery.

Monthly net sales

Executive summary

What management needs to know

Revenue and volume

400 unique order IDs produce 68,512,455.79 CU net sales across 4,446 units. The 20 distinct customer-name labels are not verified unique customers.

Category dependency

Electronics contributes 86.2% of revenue but only 37.2% of orders. Category mix matters more than a simple order-count view.

Monthly volatility

April is the highest month at 13.37 million CU. May falls 45.0% month-over-month; June rebounds 60.6%. These changes do not by themselves establish a persistent trend.

Fulfilment observation

Average delivery duration is 5.46 days; 116 orders (29.0%) take more than seven days. Seven days is an exploratory threshold, not a contractual SLA.

Immediate priorities

Validate product pricing and customer identifiers; investigate the May mix change; review discount authorization; compare fulfilment durations by comparable products and routes.

Scope and report guide

Reader navigation

Page	Topic

20	Limitations and audit trail

Data preparation and quality

Preserve valid values; flag uncertainty

Validation	Finding
Input rows / retained rows	400 / 400
Exact duplicate rows / duplicate IDs	0 / 0
Missing source values	0 across 11 fields
Invalid parsed dates	0
Nonpositive quantity or price	0
Discount outside 0–100%	0
Delivery before order date	0

Transformations

Read the tab-separated data; trim surrounding whitespace in descriptive fields; parse ISO dates; retain all valid records; calculate gross sales, discount amount, net sales, delivery days and order month.

No invented corrections

Wide product-price variation is retained because there is no authoritative price list. Names are not merged or expanded into invented customer identities.

Source coverage

Order dates span January 01, 2026 to June 29, 2026. June completeness is not confirmed; delivery records extend to July 06, 2026.

KPI dictionary

Definitions used consistently in report and dashboard

Metric	Definition
Orders	Distinct Order_ID; all IDs are unique here
Customer labels	Distinct Customer text; not verified accounts
Gross sales	Quantity x Unit_Price
Discount amount	Gross sales x Discount_% / 100
Net sales	Gross sales minus discount amount
Average order value	Net sales / distinct orders
Weighted discount rate	Total discount / total gross sales
Delivery duration	Delivery_Date minus Order_Date, days
Over 7-day share	Orders with delivery days > 7 / orders
Monthly growth	(Current net / previous net - 1) x 100

Revenue qualification

Calculated net sales are order-value estimates from the supplied fields. Tax, shipping, returns, cancellations, collection status and accounting recognition are not provided.

Time attribution

Revenue is grouped by order month, not delivery month. All calculations use the entire supplied dataset unless dashboard filters are applied.

Revenue and volume

Core commercial performance

Indicator	Value
Units	4,446.00
Gross sales	74,113,394.00
Discount amount	5,600,938.21
Net sales	68,512,455.79
Average order value	171,281.14
Weighted discount %	7.56

Sales bridge

74,113,394.00 CU gross value less 5,600,938.21 CU discounts equals 68,512,455.79 CU calculated net sales.

Discount exposure

Weighted discount is 7.56%. This is foregone list-price value, not proven avoidable loss or a profit estimate.

Monthly performance

Trend, volume and category mix

Month	Orders	Net sales (CU)	MoM
2026-01	69	12,890,801.75	--
2026-02	59	10,936,347.28	-15.2%
2026-03	68	12,155,146.97	11.1%
2026-04	70	13,371,821.04	10.0%
2026-05	67	7,351,464.83	-45.0%
2026-06	67	11,806,873.92	60.6%

May investigation

May has 67 orders versus 70 in April, while units rise from 783 to 796. The revenue decline is not explained by lower unit volume alone; review prices and product/category mix.

Incomplete-period risk

June has records through June 29, 2026. Confirm full-month coverage before treating its rebound as a final month-end result.

Category segmentation

Portfolio concentration

Category	Orders	Revenue share	Net sales (CU)
Electronics	149	86.16%	59,028,632.88
Furniture	129	13.36%	9,154,425.04
Stationery	122	0.48%	329,397.87

High-value category

Electronics yields 396,165.32 CU per order on average. Its revenue dominance creates a dependency worth monitoring.

Lower revenue is not lower profit

Stationery contributes little revenue but could still have attractive margins or strategic cross-sell value. Cost and margin data are required before deprioritizing it.

Geographic performance

City segments, not market penetration

City	Orders	Net sales (CU)	Avg days
Mumbai	57	10,888,398.20	5.32
Pune	54	10,074,510.36	5.20
Satara	50	9,975,808.42	5.68
Nagpur	40	8,901,977.57	5.70
Kolhapur	49	8,136,046.72	4.92
Aurangabad	53	7,561,652.83	5.70
Nashik	47	7,525,998.59	5.40
Solapur	50	5,448,063.10	5.80

Management use

Mumbai leads observed revenue. Compare category mix and order value before allocating resources; no city market size, service cost or territory potential is supplied.

Product portfolio

Product-level revenue and pricing review

Top observed product

Monitor generates 13,416,596.88 CU across 32 orders. Ranking measures sales value, not margin.

Price validation

Electronics labels include high-priced Mouse, Keyboard and Headset records. Product names alone are insufficient to determine price validity; verify SKU, specification, currency and unit-of-measure mappings.

Action

Add SKU identifiers, approved price lists and cost of goods. Separate price/mix changes from quantity changes and identify cross-sell opportunities only after account IDs are verified.

Salesperson performance

Normalize before evaluating individual performance

Salesperson	Orders	Net sales (CU)	AOV (CU)
Priya	92	20,169,976.26	219,238.87
Suresh	75	12,695,052.99	169,267.37
Amit	74	12,260,924.98	165,688.18
Rahul	72	11,794,043.74	163,806.16
Kavya	87	11,592,457.82	133,246.64

Fair comparisons

Priya leads observed revenue. Rankings may reflect assignment mix, territory and customer portfolio rather than sales skill. No quotas, working hours, leads or margin targets are available.

Recommendation

Build category-adjusted comparisons and include conversion rate, repeat business and contribution margin before using this view for incentives.

Customer-name insights

Identity limitations and concentration

Observed concentration

The top five name labels account for 44.0% of net sales. Deepak is the largest revenue label at 7,239,575.91 CU.

Not verified customers

There are 20 distinct first-name labels. Records with the same name may represent different people; this prevents reliable customer lifetime value, retention or churn estimates.

Segmentation proposal

After identity resolution, group verified accounts by revenue, frequency and recency. Until then use name-label summaries only as exploratory views.

Account planning

Validate high-value labels with the sales team before outreach. Add account IDs, acquisition dates and cancellation/return information for robust relationship analytics.

Discount analysis

Commercial control without causal claims

Rate	Orders	Discount amount (CU)
0%	52	0.00
2%	67	165,220.58
5%	47	395,837.30
7%	64	830,704.14
10%	54	1,092,552.00
12%	58	1,691,823.24
15%	58	1,424,800.95

Sensitivity, not expected gain

One percentage point less discount on the same gross sales would add 741,133.94 CU arithmetically, assuming quantities and list prices do not change. Demand response and margin effects are unknown.

Control recommendation

Review high-value discount approvals and record deal rationale. Do not infer that reducing discounts will preserve volumes without a controlled evaluation.

Delivery-duration analysis

Operational screening, not an SLA assessment

Duration metric	Value
Mean	5.46 days
Median	5 days
90th percentile	10 days
Range	1–10 days
More than 7 days	116 / 400 (29.0%)

Possible bottlenecks

The duration distribution screens for routes or product groups needing investigation. No dispatch timestamps, warehouse stages, carrier, promised date or backlog is supplied, so the root cause cannot be located.

Action

Collect promised, pick, dispatch and delivery timestamps; agree category- and route-specific targets; track actual versus promised delivery.

Correlation analysis

Association is not causation

Relationship with net sales	Pearson r
Quantity	0.363
Unit_Price	0.844
Discount_%	-0.002
Delivery_Days	0.017

Mechanical relationship

Net sales are calculated from unit price and quantity, so positive correlations with these fields are partly built into the formula. Category mix is an additional confounder.

Discount interpretation

A near-zero aggregate discount/revenue correlation does not prove discounts have no commercial effect. There is no counterfactual, random assignment or demand history.

Analytical boundary

No causal model, statistical significance claim or treatment effect is reported. Analyze within comparable SKUs and test pricing changes with business safeguards.

Risk and bottleneck register

Observed signals and required verification

1 | Category concentration | High monitoring priority

Electronics generates 86.2% of net sales. Owner: commercial lead. Action: monitor category contribution and large-order exposure; add supplier and margin data.

2 | Customer identity | High data priority

First names are not reliable account keys. Owner: data steward. Action: map all records to validated customer IDs before retention, concentration or outreach decisions.

3 | Price and SKU integrity | Validation priority

Large price variation may reflect specification mix or mapping errors. Owner: finance/product operations. Action: reconcile to approved SKUs and price lists; retain valid records.

4 | Monthly mix volatility | Commercial review

May revenue decreases sharply while units rise. Owner: sales operations. Action: decompose category, product and price mix; check source completeness.

5 | Fulfilment visibility | Operational data gap

116 orders exceed an exploratory seven-day duration. Owner: operations. Action: add stage timestamps and promised delivery dates to distinguish waiting time from transit.

6 | Margin and cash visibility | Decision limitation

Costs, returns, taxes and payment data are missing. Owner: finance. Action: extend the dataset before profit, cash-flow or investment decisions.

Historical forecasting baseline

As-of June 2026; not a verified current forecast

Model and assumptions

A constant monthly-mean baseline estimates 11,418,742.63 CU per month using six observations. It assumes stable average demand, mix and data coverage; no seasonality can be reliably estimated.

Small-sample backtest

Expanding-window predictions for April, May and June use only prior months. Three errors produce MAE 2,276,848.12 CU and RMSE 2,999,214.38 CU. This is too small a test set for robust model selection.

Target month	Baseline (CU)	Indicative low	Indicative high
2026-07	11,418,742.63	5,540,282.45	17,297,202.81
2026-08	11,418,742.63	5,540,282.45	17,297,202.81
2026-09	11,418,742.63	5,540,282.45	17,297,202.81

Range qualification

The range is baseline plus/minus 1.96 times backtest RMSE, floored at zero. It is an illustrative planning range, not a calibrated 95% prediction interval.

Date qualification

July–September 2026 are historical target months as of October 4, 2026. Actuals for these months are not supplied, so the baseline cannot be validated or presented as an up-to-date forward forecast.

Next step

Obtain complete data through the latest closed month and preferably at least 12–24 months. Compare mean, naive and seasonal baselines on more out-of-sample periods.

Management action plan

Proposed sequence; benefits are not guaranteed

First 2 weeks | Data steward and finance

Validate customer IDs, currency, SKU mapping, price lists and June coverage. Deliver an exception log and reconciliation of order values. Success measure: every order has a valid account and SKU key.

Weeks 2–4 | Sales operations

Investigate May performance using category/product mix and order-value changes. Review high-value discount approvals. Success measure: documented drivers and assigned corrective actions.

Weeks 2–6 | Operations

Add promised delivery dates and dispatch stages. Define realistic service targets by route/category. Success measure: traceable delivery stages and an agreed SLA, not an arbitrary universal target.

Weeks 4–8 | Finance and BI

Integrate cost, returns, taxes and payment information. Add margin and cash KPIs. Success measure: reconciled revenue and profit views with clear accounting definitions.

Monthly | Business leadership

Review refreshed dashboard, category concentration, mix changes, discount exposure and delivery exceptions. Refresh forecasting only after current complete-month data arrives.

Governance

The owners and timeline above are recommendations, not observed assignments. Approve scope, accountable owners and numerical targets before rollout.

Interactive dashboard guide

Filtering and user-triggered refresh

Executive overview

The dashboard calculates net/gross sales, discounts, orders, units, customer-name labels, AOV and delivery-duration metrics from the selected records.

Interactive controls

Use category, city, salesperson, customer name and order-date filters. All charts, KPI cards, tables and generated insights recompute together. Reset restores the full uploaded dataset.

Visual analysis

Explore monthly revenue, category/city/salesperson comparisons, customer labels, delivery duration and a filtered detail table. Hover bars or points for values.

Refresh

Upload a replacement CSV or TSV containing the same source columns (the cleaned CSV also works). The dashboard validates required fields, dates, numeric ranges, duplicate IDs and delivery chronology before replacing its in-memory data.

Live boundary

Interactivity is live in the browser. Refresh is user-triggered; there is no database/API connection, background synchronization, hosting URL or real-time streaming integration configured.

Deployment and privacy

The embedded dashboard operates without chart-library downloads. Uploads stay in the browser; no upload service is configured. Deploy on an approved internal host with authentication if customer records will be shared.

Limitations and audit trail

Reproducibility and decision readiness

Verified findings

All numerical findings derive from the 400 supplied order rows. Cleaning retains all valid rows; additional columns are transparent arithmetic transformations. Aggregated outputs accompany the report.

Unavailable context

Currency, costs, margins, targets, stable customer IDs, SKU specifications, promised dates, returns, order status and collections are absent. No market benchmarking or claims about profitability, churn or SLA breaches are justified.

Forecast limitation

Only January–June 2026 orders are supplied. Historical July–September baseline estimates are not actual results and are not a current forward forecast as of October 4, 2026.

Report versus dashboard

The 20-page PDF and workbook are fixed snapshots of the original data. Uploaded dashboard replacements recalculate browser views but do not automatically rewrite the PDF or workbook.

Delivered assets

20-page PDF report; cleaned order CSV; KPI CSV; multi-sheet analysis workbook; historical forecast baseline CSV; interactive dashboard with filtering, detail view, insight generation and CSV/TSV refresh.

Decision standard

Confirm data completeness and business definitions with accountable owners. Treat operational concerns as investigation candidates, and test interventions rather than assuming correlations imply causes.
